Debbie,

I assume you will also want a summary of our air monitoring conducted with hand held pDR and MultiRAE at the standard air monitoring locations? That data would include H2S, which was not on any of the AreaRAEs and also LEL, which was not accurate on the AreaRAEs.

Subject: Trip Report for the Ames Warehouse Fire

Hi [REDACTED]
Ex. 4 - CBI

Given the fact that we were moving in some many different directions during the Ames Warehouse Fire ER and that EPA was compiling some of the data in order to get it posted – I would like to have a Trip Report or Data Summary Report to pull of the information together so we have field observations included with the data and graphs. Plus identify field constraints,

monitoring location selections, weather and other pertinent information..

This would be similar to most of the Trip Reports that you do. I don't want you to recreate graphs or tables – we can extract them from the EPA website – or have them modified by Jessica Duffy (who has been working on these)

I think it is important to document what we did, why we did certain things, some of our limitations and the results.

We should include the Particulate Monitoring, Area Rae Monitoring and the Summa Canister TO15 sampling.

For comparisons – we can use the AQL Tables for the Particulate Monitoring and I will talk to ATSDR on the Area Raes and Summa Canisters what we should consider using...or we leave them blank since ATSDR will be doing their health evaluation

Please let me know what type of timeframe you think this could be completed in and let me know if we need additional hours. I don't see this being a huge level of effort – let me know what you think

Thanks

Debbie Lindsey
